

Nitrogen Mustard (Mustargen[®])

Mechlorethamine

5 mg/5 mL (1 mg/mL)

INJECTION
SOLUTION

- Commercially available mechlorethamine was originally produced by making a sterile, endotoxin-free solution that was validated, and then lyophilized into a sterile powder ready for reconstitution. After reconstitution, the sterile product was subject to quick degradation.
- Other companies/compounders have provided mechlorethamine as a raw, non-sterile powder weighed into vials and provided with a 0.2/0.22 micron filter. Because the final solution is non-sterile, the product is purported to be sterilized in place with the provided filter. This method cannot be validated and does not provide sterility assurance or potency analysis as weighing errors would be difficult to quantify. Further, endotoxin concentration cannot be assured when provided in this manner. There is substantial risk of injury to the patient.
- **Epicur Pharma's mechlorethamine is prepared following cGMP and provided as a validated, pre-sterilized concentrate formulated to inhibit degradation until diluted.** This formulation is preferred by veterinarians because the vial provided has already passed testing for potency, sterility, and endotoxins using validated methods and formulation.

- ✓ **Manufactured** in an FDA Registered Facility
- ✓ No need to filter, just dilute!
- ✓ Potency, sterility and endotoxins validated
